# Une notion de récurrence dans le modèle du tas de sable sur le réseau carré 

Henri Derycke joint work with Yvan Le Borgne

LaBRI

JCB 2019, Février 11-13, Bordeaux

## Sandpile Model [Bak, Tang, Wiesenfeld 87]

Configuration: $\eta: V \mapsto \mathbb{N}$ $v \in V$ is unstable for $\eta$ if $\eta(v) \geq \operatorname{deg}(v)$, it is stable otherwise.

## Sandpile Model [Bak, Tang, Wiesenfeld 87]

Configuration: $\eta: V \mapsto \mathbb{N}$
$v \in V$ is unstable for $\eta$ if $\eta(v) \geq \operatorname{deg}(v)$, it is stable otherwise. Toppling $u: \eta \mapsto \eta+\Delta^{(u)}$ If $u$ is unstable, the toppling is legal. It is forced otherwise.

## Sandpile Model [Bak, Tang, Wiesenfeld 87]

Configuration: $\eta: V \mapsto \mathbb{N}$
$v \in V$ is unstable for $\eta$ if $\eta(v) \geq \operatorname{deg}(v)$, it is stable otherwise. Toppling $u: \eta \mapsto \eta+\Delta^{(u)}$ If $u$ is unstable, the toppling is legal. It is forced otherwise.

## Sandpile Model [Bak, Tang, Wiesenfeld 87]

Configuration: $\eta: V \mapsto \mathbb{N}$
$v \in V$ is unstable for $\eta$ if $\eta(v) \geq \operatorname{deg}(v)$, it is stable otherwise. Toppling $u: \eta \mapsto \eta+\Delta^{(u)}$ If $u$ is unstable, the toppling is legal. It is forced otherwise.

## Sandpile Model [Bak, Tang, Wiesenfeld 87]

Configuration: $\eta: V \mapsto \mathbb{N}$
$v \in V$ is unstable for $\eta$ if $\eta(v) \geq \operatorname{deg}(v)$, it is stable otherwise. Toppling $u: \eta \mapsto \eta+\Delta^{(u)}$ If $u$ is unstable, the toppling is legal. It is forced otherwise.

## Sandpile Model [Bak, Tang, Wiesenfeld 87]

Configuration: $\eta: V \mapsto \mathbb{N}$
$v \in V$ is unstable for $\eta$ if $\eta(v) \geq \operatorname{deg}(v)$, it is stable otherwise. Toppling $u: \eta \mapsto \eta+\Delta^{(u)}$ If $u$ is unstable, the toppling is legal. It is forced otherwise.

## Sandpile Model [Bak, Tang, Wiesenfeld 87]

Configuration: $\eta: V \mapsto \mathbb{N}$
$v \in V$ is unstable for $\eta$ if $\eta(v) \geq \operatorname{deg}(v)$, it is stable otherwise.
Toppling $u: \eta \mapsto \eta+\Delta^{(u)}$ If $u$ is unstable, the toppling is legal. It is forced otherwise.
The order of toppling does not change the result: $\eta \rightarrow \eta+\sum_{v \in V} a_{v} \Delta^{(v)}$.

## Sandpile Model [Bak, Tang, Wiesenfeld 87]

Configuration: $\eta: V \mapsto \mathbb{N}$
$v \in V$ is unstable for $\eta$ if $\eta(v) \geq \operatorname{deg}(v)$, it is stable otherwise.
Toppling $u: \eta \mapsto \eta+\Delta^{(u)}$ If $u$ is unstable, the toppling is legal. It is forced otherwise.
The order of toppling does not change the result: $\eta \rightarrow \eta+\sum_{v \in V} a_{v} \Delta^{(v)}$.

## Stabilisation

Stabilisation : while a vertex is unstable, topple it.

## The sink

How to stabilize (even with a large number of grains)?

| 2 | 2 |
| :--- | :--- |
| 3 | 3 |
| 2 | 2 |

## The sink

How to stabilize (even with a large number of grains)?

| 2 | 2 |
| :--- | :--- |
| 3 | 3 |
| 2 | 2 |

We distinguish a vertex as the sink that won't topple.

## The sink

How to stabilize (even with a large number of grains)?

| 2 | 2 |
| :--- | :--- |
| 3 | 3 |
| 2 | 2 |$\xrightarrow{\text { Stabilisation }}$| 0 | 1 |
| :--- | :--- |
| 2 | 2 |
| 9 | 1 |

We distinguish a vertex as the sink that won't topple.
The sink guarantees that the stabilisation of any configuration $\eta$ terminates and we note the result mathsfstab $(\eta)$.

## The sink

How to stabilize (even with a large number of grains)?

| 2 | 2 |
| :--- | :--- |
| 3 | 3 |
| 2 | 2 |$\xrightarrow{\text { Stabilisation }}$| 0 | 1 |
| :--- | :--- |
| 2 | 2 |
| 9 | 1 |

We distinguish a vertex as the sink that won't topple.
The sink guarantees that the stabilisation of any configuration $\eta$ terminates and we note the result mathsfstab $(\eta)$.

## Markov Chain

- States: stable configurations on $G$
- Transition: Add a particle from the sink to a vertex chosen uniformly and stabilize
Recurrent states are in the same connected component.

## The sink

How to stabilize (even with a large number of grains)?

| 2 | 2 |
| :--- | :--- |
| 3 | 3 |
| 2 | 2 |$\xrightarrow{\text { Stabilisation }}$| 0 | 1 |
| :--- | :--- |
| 2 | 2 |
| 9 | 1 |$\xrightarrow{\text { transition }}$| $\boldsymbol{1}^{1}$ | 1 |
| :---: | :---: |
| 2 | 2 |
| 8 | 1 |

We distinguish a vertex as the sink that won't topple.
The sink guarantees that the stabilisation of any configuration $\eta$ terminates and we note the result mathsfstab $(\eta)$.

## Markov Chain

- States: stable configurations on $G$
- Transition: Add a particle from the sink to a vertex chosen uniformly and stabilize
Recurrent states are in the same connected component.

## Test of recurrence

Dhar operator
Topple the sink (forced), then stabilize: $\operatorname{dhar}(\eta):=\operatorname{stab}\left(\eta+\Delta^{(s)}\right)$

## Test of recurrence

Dhar operator
Topple the sink (forced), then stabilize: $\operatorname{dhar}(\eta):=\operatorname{stab}\left(\eta+\Delta^{(s)}\right)$

| 0 | 1 |
| :--- | :--- |
| 2 | 2 |
| $s$ | 1 |

## Test of recurrence

Dhar operator
Topple the sink (forced), then stabilize: $\operatorname{dhar}(\eta):=\operatorname{stab}\left(\eta+\Delta^{(s)}\right)$

## Bijections with spanning trees

Theorem (Dhar, Majumdar 92)
The recurrent configurations for a finite graph $G$ and its spanning trees are in bijection.
Several bijections:
Dhar/Majumdar 92 (e.g. Haglund bounce's path for sorted recurrents on $K_{n}$ )
Bernardi 06 (e.g. Visiting frontier in planar maps between primal/dual spanning trees)
Cori/Le Borgne 03 (CLB) (e.g. Dhar criterion more uniform in space)

```
Mark edges incident to the sink as pending edges.
While there is a pending edge
    Get the closest pending edge to the sink
    Process the grain(s) on the edge
    If a vertex become unstable, topple it and mark its
        untreated incident edges as pending edges.
```

Edge-vertex traversal: $s$,

## Bijections with spanning trees

Theorem (Dhar, Majumdar 92)
The recurrent configurations for a finite graph $G$ and its spanning trees are in bijection.
Several bijections:
Dhar/Majumdar 92 (e.g. Haglund bounce's path for sorted recurrents on $K_{n}$ )
Bernardi 06 (e.g. Visiting frontier in planar maps between primal/dual spanning trees)
Cori/Le Borgne 03 (CLB) (e.g. Dhar criterion more uniform in space)

```
Mark edges incident to the sink as pending edges.
While there is a pending edge
    Get the closest pending edge to the sink
    Process the grain(s) on the edge
    If a vertex become unstable, topple it and mark its
        untreated incident edges as pending edges.
```

Edge-vertex traversal: $s, e_{1}$,

## Bijections with spanning trees

Theorem (Dhar, Majumdar 92)
The recurrent configurations for a finite graph $G$ and its spanning trees are in bijection.
Several bijections:
Dhar/Majumdar 92 (e.g. Haglund bounce's path for sorted recurrents on $K_{n}$ )

    Get the closest pending edge to the sink
    Process the grain(s) on the edge
    If a vertex become unstable, topple it and mark its
        untreated incident edges as pending edges.
```

Edge-vertex traversal: $s, e_{1}, e_{2}, v_{2}, e_{3}, e_{5}, v_{4}, e_{6}, v_{3}, e_{4}, v_{1}$,

## Bijections with spanning trees

Theorem (Dhar, Majumdar 92)
The recurrent configurations for a finite graph $G$ and its spanning trees are in bijection.
Several bijections:
Dhar/Majumdar 92 (e.g. Haglund bounce's path for sorted recurrents on $K_{n}$ )
Bernardi 06 (e.g. Visiting frontier in planar maps between primal/dual spanning trees)
Cori/Le Borgne 03 (CLB) (e.g. Dhar criterion more uniform in space)

```
Mark edges incident to the sink as pending edges.
While there is a pending edge
    Get the closest pending edge to the sink
    Process the grain(s) on the edge
    If a vertex become unstable, topple it and mark its
        untreated incident edges as pending edges.
```

Edge-vertex traversal: $s, e_{1}, e_{2}, v_{2}, e_{3}, e_{5}, v_{4}, e_{6}, v_{3}, e_{4}, v_{1}, e_{7}$,

## Counting grains

In Dhar criterion, each edge captures the last grain that crosses it. For any recurrent configuration $\eta$ on $G=(V \cup\{s\}, E)$,

$$
\operatorname{level}(\eta)=\left(\sum_{v \in V} \eta(v)\right)+\operatorname{deg}(s)-|E|
$$

Let $R_{G}(y)=\sum_{\eta \in \operatorname{Rec}(G, s)} y^{\text {level }(\eta)}$
Theorem (López 97)
For any graph $G=(V \cup\{s\}, E)$,

$$
R_{G}(y)=\operatorname{Tutte}_{G}(1, y)
$$

where $\operatorname{Tutte}_{G}(1, y)=\sum_{T \in \Sigma(G)} y^{\operatorname{ext}(T)}$ counts on spanning trees the number of active external edges: external edges that are maximal in their fundamental cycle.

## Counting grains

In Dhar criterion, each edge captures the last grain that crosses it. For any recurrent configuration $\eta$ on $G=(V \cup\{s\}, E)$,

$$

where $\operatorname{Tutte}_{G}(1, y)=\sum_{T \in \Sigma(G)} y^{\operatorname{ext}(T)}$ counts on spanning trees the number of active external edges: external edges that are maximal in their fundamental cycle.

## Tracking external activity while changing order on edges

 With $e_{1}<_{E} e_{2}<_{E} \cdots<_{E} e_{|E|}$ an order on the edges of $E$, an external edge is active if it is maximal for $<_{E}$ in its fundamental cycle.

## Proposition

$\operatorname{Tutte}_{G}(1, y)=\sum_{T \in \Sigma(G)} y^{\operatorname{ext}<_{E}(T)}$ does not depend on $<_{E}$

## Tracking external activity while changing order on edges

 With $e_{1}<_{E} e_{2}<_{E} \cdots<_{E} e_{|E|}$ an order on the edges of $E$, an external edge is active if it is maximal for $<_{E}$ in its fundamental cycle.

## Proposition

$\operatorname{Tutte}_{G}(1, y)=\sum_{T \in \Sigma(G)} y^{\operatorname{ext}_{\mathcal{C l}_{E}}(T)}$ does not depend on $<_{E}$ $\left\{e_{i}, e_{j}\right\}$ is a critical pair if
$\rightarrow e_{i}$ is external

- $e_{j}$ is on $e_{i}$ fundamental cycle
- $e_{i}$ and $e_{j}$ are maximal on $e_{i}$ fundamental cycle

## Tracking external activity while changing order on edges

 With $e_{1}<_{E} e_{2}<_{E} \cdots<_{E} e_{|E|}$ an order on the edges of $E$, an external edge is active if it is maximal for $<_{E}$ in its fundamental cycle.

## Proposition

$\operatorname{Tutte}_{G}(1, y)=\sum_{T \in \Sigma(G)} y^{\operatorname{ext}<_{E}(T)}$ does not depend on $<_{E}$ $\left\{e_{i}, e_{j}\right\}$ is a critical pair if

- $e_{i}$ is external
- $e_{j}$ is on $e_{i}$ fundamental cycle
- $e_{i}$ and $e_{j}$ are maximal on $e_{i}$ fundamental cycle Let $\tau_{i}$ exchanging $e_{i}$ and $e_{i+1}$ in $<_{E}$.

$$
\Phi_{i}(T)= \begin{cases}T \Delta\left\{e_{i}, e_{i+1}\right\} & \text { if }\left\{e_{i}, e_{i+1}\right\} \text { is a critical pair of } T \\ T & \text { otherwise }\end{cases}
$$

Lemma: for all $T \operatorname{ext}_{<_{E}}(T)=\operatorname{ext}_{\tau_{i}\left(<_{E}\right)}\left(\Phi_{i}(T)\right)$.

## Tutte Polynomial

Let a graph $G=(V, E)$ and $<_{E}$ an order on the edges of $E$.

$$
\operatorname{Tutte}_{G}(x, y)=\sum_{T \in \Sigma(G)} x^{\operatorname{int}(T)} y^{\operatorname{ext}(T)}
$$

Active external edge: maximal in its fundamental cycle. Active internal edge: maximal in its co-cycle.

$e_{6}$ is active with fundamental cycle $\left(e_{3}, e_{4}, e_{6}\right) . e_{5}$ is active with co-cycle $\left(e_{1}, e_{2}, e_{5}\right)$.

For $G=K_{4}, \operatorname{Tutte}_{G}(x, y)=x^{3}+y^{3}+3 x^{2}+4 x y+3 y^{2}+2 x+2 y$ and $T$ weights $x y$.
When $G$ is planar, $\operatorname{Tutte}_{G}(x, y)=\operatorname{Tutte}_{G^{*}}(y, x)$. Then if planar and self-dual, $\operatorname{Tutte}_{G}(x, y)=\operatorname{Tutte}_{G}(y, x)$

## Periodicity on -s

## Lemme

If a periodic configuration is recurrent, then there exists a position $y=t_{1}$ for which all vertices of the first period are toppled.

We
have Period $1 \subset E_{0, t_{1}} \Rightarrow E_{0, t_{1}}=E_{H, t_{1}-H}$ and $v \in E_{0, t_{1}} \Rightarrow v+H \vec{y} \in E_{H, t_{1}}$. Then $E_{H, t_{1}} \supset$ Period2.
