Labelling $\alpha \xrightarrow{j} \beta$ if and only if β is at position j in $\psi(\alpha)$.

Binary numeration system for \mathbb{N}

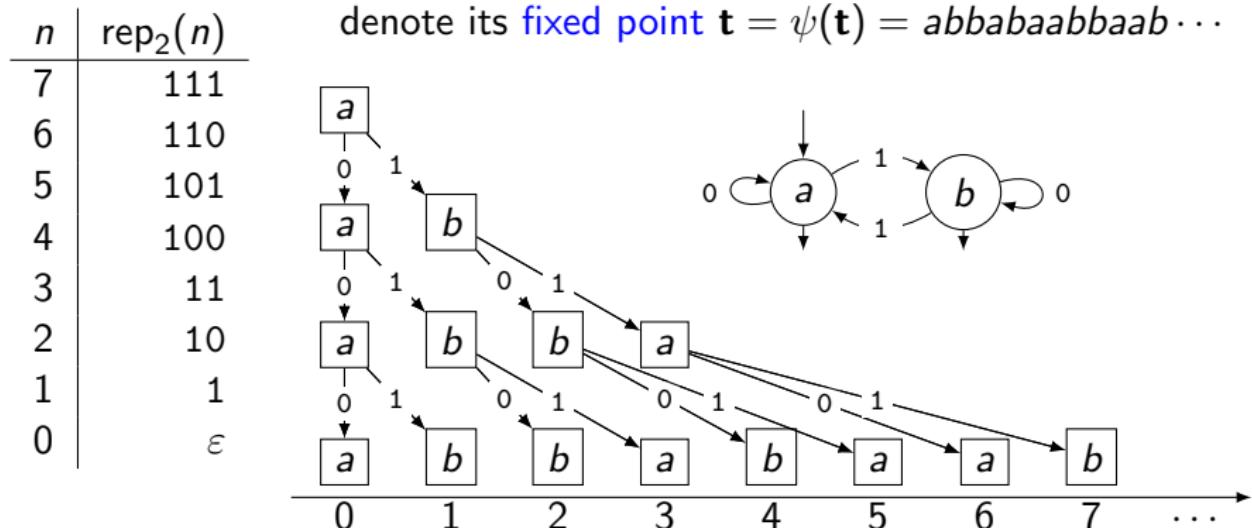

- Let ψ be the substitution $\psi: a \mapsto ab, b \mapsto ba$ and denote its fixed point $t = \psi(t) = abbabaabbaab\cdots$

Labelling $\alpha \xrightarrow{j} \beta$ if and only if β is at position j in $\psi(\alpha)$.

Binary numeration system for \mathbb{N}

- Let ψ be the **substitution** $\psi: a \mapsto ab, b \mapsto ba$ and denote its **fixed point** $\mathbf{t} = \psi(\mathbf{t}) = abbabaabbaab\cdots$

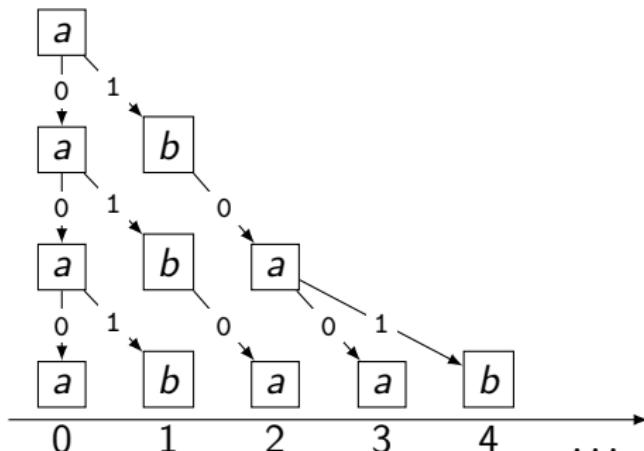

Theorem (Cobham, 1972)

Let $k \geq 2$. A right-infinite word $\mathbf{x} = x_0x_1x_2\cdots$ is a fixed point of a **k -uniform substitution** if and only if there exists deterministic finite automaton with output \mathcal{A} such that $x_n = \mathcal{A}(\text{rep}_k(n))$, for all $n \in \mathbb{N}$.

Fibonacci numeration system for \mathbb{N}

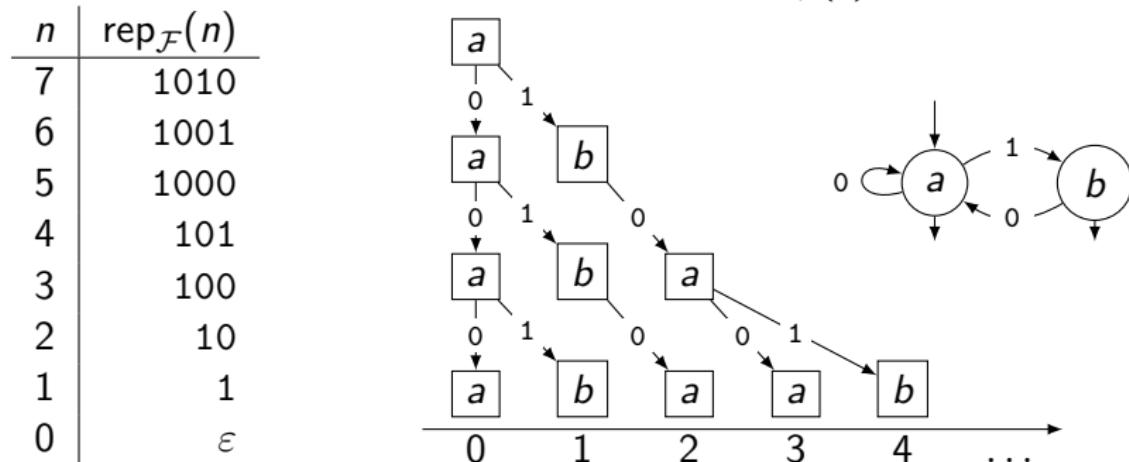

- Let φ be the **substitution** $\varphi: a \mapsto ab, b \mapsto a$ and denote its **fixed point** $f = \varphi(f) = abaababaabaabab\dots$

n	$\text{rep}_{\mathcal{F}}(n)$

Theorem (P. Lecomte, M. Rigo, 2001)

An infinite word $x = x_0x_1x_2\dots$ is an image under a coding of a fixed point of a **substitution** if and only if there exists deterministic finite automaton with output \mathcal{A} and an **abstract numeration system** \mathcal{S} s.t. $x_n = \mathcal{A}(\text{rep}_{\mathcal{S}}(n))$, for all $n \in \mathbb{N}$.

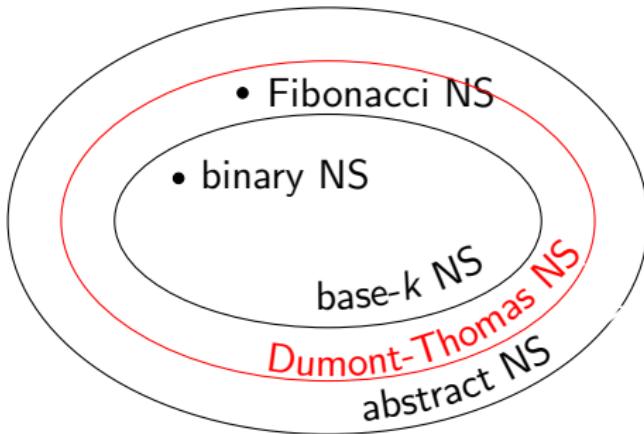

Numeration systems for \mathbb{N}

Numeration systems for \mathbb{N}

Numeration systems for \mathbb{N}

Goal: numeration systems based on ideas of Dumont and Thomas **for \mathbb{Z}** .

Outline

- 1 Introduction to numeration systems
- 2 Motivation: description of substitutive Wang tilings
- 3 Numeration systems for \mathbb{N} based on fixed points
- 4 Numeration systems for \mathbb{Z} based on periodic points
- 5 Properties of Dumont–Thomas numeration systems for \mathbb{Z}

Wang tiles

A Wang tile is a square tile with 4 edge labels and an index.

J O 0 D O	O H 1 D L	M D 2 J P	M D 3 D K	P J 4 H P	P H 5 H N	K D 6 H P	O I 7 B O
L E 8 I O	L C 9 I L	L I 10 A O	P I 11 E P	P I 12 I K	K B 13 I M	K A 14 I K	N I 15 C P

A particular set of 16 Wang tiles \mathcal{Z} .

Adjacent tiles with distinct label on common edge are forbidden:

O H 1 D L	M D 3 D K
-----------------------	-----------------------

Allowed.

M D 2 J P	M D 3 D K
-----------------------	-----------------------

Forbidden.

A configuration $x : \mathbb{Z}^2 \rightarrow \mathcal{Z}$ without forbidden pattern is said valid.

The set $\Omega_{\mathcal{Z}}$ of all valid configurations $x : \mathbb{Z}^2 \rightarrow \{0, \dots, 15\}$ is called the Wang shift $\Omega_{\mathcal{Z}}$ associated to the set \mathcal{Z} of Wang tiles.

Configuration in a particular Wang shift $\Omega_{\mathcal{Z}}$

A finite part of a particular configuration $y \in \Omega_{\mathcal{Z}}$.

Question

Does there exist a deterministic finite **automaton** with output \mathcal{A} and a **numeration system** rep for \mathbb{Z}^2 so that, for all $\mathbf{n} \in \mathbb{Z}^2$, $y_{\mathbf{n}} = \mathcal{A}(\text{rep}(\mathbf{n}))$?

Necessary step: extend Dumont–Thomas numeration systems to \mathbb{Z} and \mathbb{Z}^2 .

Moreover, we study two-sided **periodic points** instead of **fixed points**.

Outline

- 1 Introduction to numeration systems
- 2 Motivation: description of substitutive Wang tilings
- 3 Numeration systems for \mathbb{N} based on fixed points
- 4 Numeration systems for \mathbb{Z} based on periodic points
- 5 Properties of Dumont–Thomas numeration systems for \mathbb{Z}

Greedy algorithm

- Numeration system based on the sequence $(3^k)_{k=0}^{+\infty}$

k		0	1	2	3	\dots
3^k		1	3	9	27	\dots

$$11 = 9 + 2$$

$$= 1 \cdot 3^2 + 0 \cdot 3^1 + 2 \cdot 3^0$$

We obtain $\text{rep}_3(11) = 102$.

Greedy algorithm

- Numeration system based on the sequence $(3^k)_{k=0}^{+\infty}$

k		0	1	2	3	\dots
3^k		1	3	9	27	\dots

$$11 = 9 + 2$$

$$= \mathbf{1} \cdot 3^2 + \mathbf{0} \cdot 3^1 + \mathbf{2} \cdot 3^0$$

We obtain $\text{rep}_3(11) = 102$.

- Numeration system based on the fixed point $\mathbf{r} = abcbaacbbbaaab\dots$ of the substitution ρ : $a \mapsto abc$, $b \mapsto baa$, $c \mapsto cbb$

k		0	1	2	3	\dots
$\rho^k(a)$		a	abc	$abcbbaacbb$	$abcbbaacbbbaaabcabccbbbaabaa$	\dots

Greedy algorithm

- Numeration system based on the sequence $(3^k)_{k=0}^{+\infty}$

k		0	1	2	3	\dots
3^k		1	3	9	27	\dots

$$11 = 9 + 2$$

$$= 1 \cdot 3^2 + 0 \cdot 3^1 + 2 \cdot 3^0$$

We obtain $\text{rep}_3(11) = 102$.

- Numeration system based on the fixed point $\mathbf{r} = abcbaacbbbaaab\dots$ of the substitution ρ : $a \mapsto abc$, $b \mapsto baa$, $c \mapsto cbb$

k		0	1	2	3	\dots
$\rho^k(a)$		a	abc	$abcbaacbb$	$abcbaacbbbaaababcabccbbbaabaa$	\dots

We aim to represent $n = 11$, thus we take the prefix of \mathbf{r} of length 11:

$$\begin{aligned}abcbaacbbba &= abcbaacbb \cdot \varepsilon \cdot ba \\&= \rho^2(\textcolor{red}{a}) \cdot \rho^1(\textcolor{red}{\varepsilon}) \cdot \rho^0(\textcolor{red}{ba})\end{aligned}$$

We obtain $\text{rep}_{\mathbf{r}}(11) = |\textcolor{red}{a}| \cdot |\textcolor{red}{\varepsilon}| \cdot |\textcolor{red}{ba}| = 102$.

Greedy algorithm

- Numeration system based on the sequence $(3^k)_{k=0}^{+\infty}$

k		0	1	2	3	\dots
3^k		1	3	9	27	\dots

$$11 = 9 + 2$$

$$= 1 \cdot 3^2 + 0 \cdot 3^1 + 2 \cdot 3^0$$

We obtain $\text{rep}_3(11) = 102$.

- Numeration system based on the fixed point $\mathbf{r} = abcbaacbbbaaab\dots$ of the substitution ρ : $a \mapsto abc$, $b \mapsto baa$, $c \mapsto cbb$

k		0	1	2	\dots
$\rho^k(a)$		a	abc	$abcbaacbb$	$abcbaacbbbaaababcabccbbbaabaa\dots$

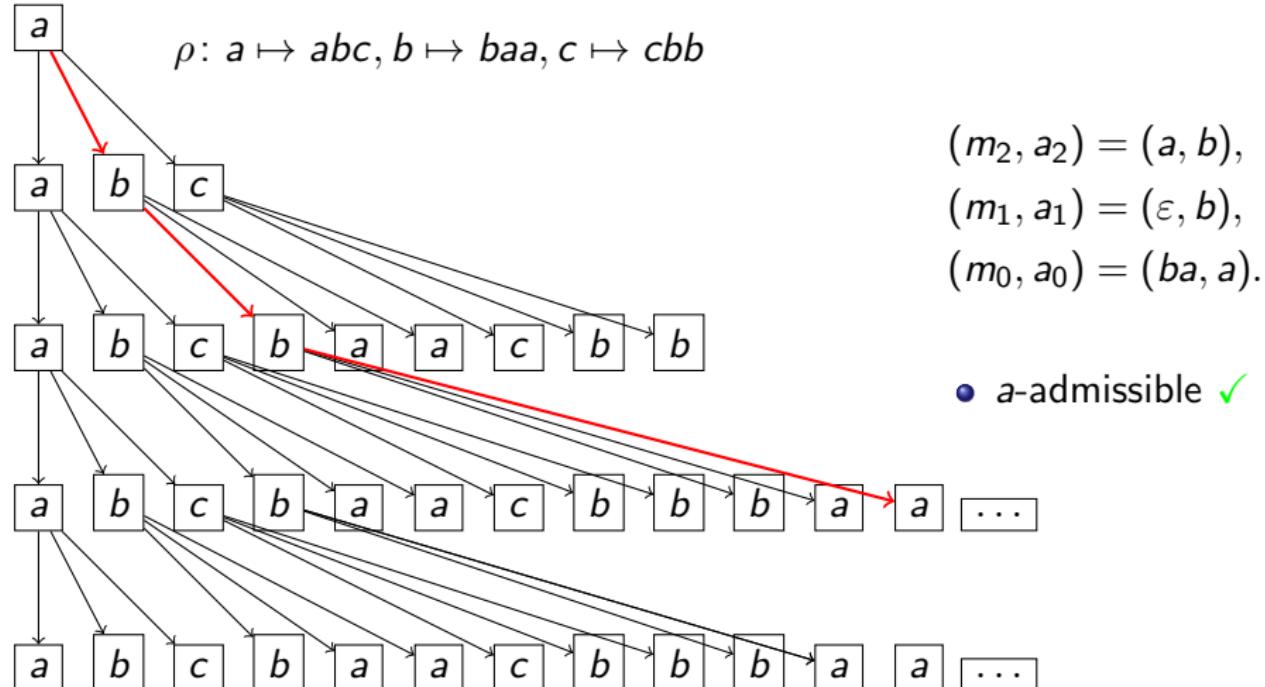

We aim to represent $n = 11$, thus we take the prefix of \mathbf{r} of length 11:

$$\begin{aligned}abcbaacbbba &= abcbaacbb \cdot \varepsilon \cdot ba \\&= \rho^2(\mathbf{a}) \cdot \rho^1(\mathbf{\varepsilon}) \cdot \rho^0(\mathbf{ba})\end{aligned}$$

We obtain $\text{rep}_{\mathbf{r}}(11) = |\mathbf{a}| \cdot |\mathbf{\varepsilon}| \cdot |\mathbf{ba}| = 102$.

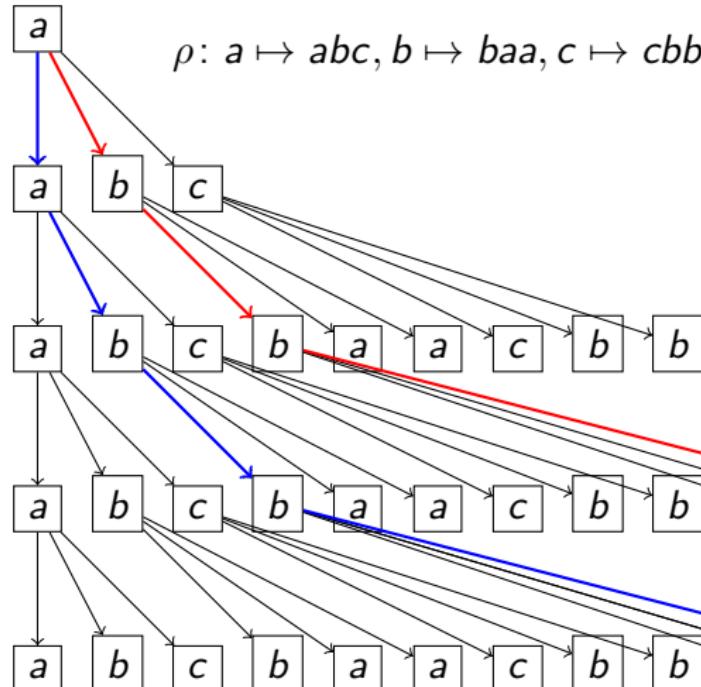

The sequence $(\mathbf{a}, b), (\mathbf{\varepsilon}, b), (\mathbf{ba}, a)$ in $A^* \times A$ is called a -admissible.

Illustration of Dumont and Thomas theorem

Recall: we obtained $\text{rep}_r(11) = |a| \cdot |\varepsilon| \cdot |ba| = 102$, where $r = \rho(\mathbf{r})$.

Illustration of Dumont and Thomas theorem

$$\rho: a \mapsto abc, b \mapsto baa, c \mapsto cbb$$

$$(m_2, a_2) = (a, b),$$
$$(m_1, a_1) = (\varepsilon, b),$$
$$(m_0, a_0) = (ba, a).$$

• a -admissible ✓

Recall: we obtained $\text{rep}_r(11) = |a| \cdot |\varepsilon| \cdot |ba| = 102$, where $r = \rho(r)$.

There exists a **unique** representation of every $n \geq 1$ with an a -admissible sequence $(m_i, a_i)_{i=0, \dots, k-1}$ such that $m_{k-1} \neq \varepsilon$.

Dumont–Thomas theorem

Theorem (Dumont, Thomas, 1989)

Let $a \in A$ and let $\eta : A^* \rightarrow A^*$ be a substitution. Let $\mathbf{u} = \eta(\mathbf{u})$ be a right-infinite fixed point of η with growing letter $u_0 = a$.

For every $n \geq 1$, there exists a **unique** sequence $(m_i, a_i)_{i=0, \dots, k-1}$ s. t.

- this sequence is **a-admissible** and $m_{k-1} \neq \varepsilon$,
- $u_0 u_1 \cdots u_{n-1} = \eta^{k-1}(m_{k-1}) \eta^{k-2}(m_{k-2}) \cdots \eta^0(m_0)$.

Note: requiring $m_{k-1} \neq \varepsilon$ is analogical to forbidding **leading zeroes** in base- k numeration systems.

E.g. $\text{rep}_3(11) = 102$, $\text{rep}_3(11) \neq 0102$.

- a two-sided **periodic point** with growing seed $a|a$ and period $p = 2$:

$$\mathbf{h} = \dots ababa.abaababaab\dots$$

It holds that $\mathbf{g} = \varphi^2(\mathbf{g})$ and $\mathbf{h} = \varphi^2(\mathbf{h})$ are fixed points of φ^2 .

Numeration systems for \mathbb{Z} based on periodic points

Theorem (Dumont, Thomas, 1989)

Let $a \in A$ and let $\eta : A^* \rightarrow A^*$ be a substitution. Let $\mathbf{u} = \eta(\mathbf{u})$ be a right-infinite fixed point of η with growing letter $u_0 = a$.

For every $n \geq 1$, there exists a **unique** sequence $(m_i, a_i)_{i=0, \dots, k-1}$ s. t.

- this sequence is **a -admissible** and $m_{k-1} \neq \varepsilon$,
- $u_0 u_1 \cdots u_{n-1} = \eta^{k-1}(m_{k-1}) \eta^{k-2}(m_{k-2}) \cdots \eta^0(m_0)$.

Numeration systems for \mathbb{Z} based on periodic points

Theorem (Dumont, Thomas, 1989)

 - ▶ p divides k ,
 - ▶ $\eta^{p-1}(m_{k-1})\eta^{p-2}(m_{k-2}) \cdots \eta^0(m_{k-p})a_{k-p} \neq \eta^p(b)$.

Numeration systems for \mathbb{Z} based on periodic points

Definition (Dumont–Thomas numeration systems for \mathbb{Z})

Let $\eta : A^* \rightarrow A^*$ be a substitution and \mathbf{u} be its two-sided periodic point with growing seed s and the period $p \geq 1$. We define

$$\text{rep}_{\mathbf{u}} : n \mapsto \begin{cases} 0 \cdot |m_{k-1}| \cdot |m_{k-2}| \cdot \dots \cdot |m_0|, & \text{if } n \geq 1; \\ 0, & \text{if } n = 0; \\ 1, & \text{if } n = -1; \\ 1 \cdot |m_{k-1}| \cdot |m_{k-2}| \cdot \dots \cdot |m_0|, & \text{if } n \leq -2, \end{cases}$$

where

- $(m_i, a_i)_{i=0, \dots, k-1}$ is the **unique** sequence from Theorem A if $n \geq 1$;
- $(m_i, a_i)_{i=0, \dots, k-1}$ is the **unique** sequence from Theorem B if $n \leq -2$.

Note that, for every $n \in \mathbb{Z}$, we have

$$|\text{rep}_{\mathbf{u}}(n)| = \ell p + 1, \text{ for some } \ell \in \mathbb{N}.$$

Periodic points as automatic sequences

Theorem (Labbé, L.)

Let $\eta : A^* \rightarrow A^*$ be a substitution and \mathbf{u} be its two-sided periodic point with growing seed $s = u_{-1}|u_0$. Then

$$u_n = \mathcal{A}_{\eta,s}(\text{rep}_{\mathbf{u}}(n)), \quad \text{for every } n \in \mathbb{Z}.$$

The Thue–Morse substitution $\psi: a \mapsto ab, b \mapsto ba$ has periodic point $\mathbf{t} = \cdots abbabaab.abbabaab \cdots$ with $s = b|a$ and period $p = 2$.

n	$\text{rep}_{\mathbf{t}}(n)$	n	$\text{rep}_{\mathbf{t}}(n)$
4	00100	-1	1
3	011	-2	110
2	010	-3	101
1	001	-4	100
0	0	-5	11011

Note that Thue–Morse substitution has no two-sided fixed point.

Characterization by a particular total order

n	-5	-4	-3	-2	-1	0	1	2	3	4
$\text{rep}_{2c}(n)$	1011	100	101	10	1	0	01	010	011	0100

Radix order: $u <_{rad} v$ if and only if $|u| < |v|$ or $|u| = |v|$ and $u <_{lex} v$

Reversed order: $u <_{rev} v$ if and only if $|u| > |v|$ or $|u| = |v|$ and $u <_{lex} v$

Characterization by a particular total order

n	-5	-4	-3	-2	-1	0	1	2	3	4
$\text{rep}_{2c}(n)$	1011	100	101	10	1	0	01	010	011	0100

Radix order: $u <_{rad} v$ if and only if $|u| < |v|$ or $|u| = |v|$ and $u <_{lex} v$

Reversed order: $u <_{rev} v$ if and only if $|u| > |v|$ or $|u| = |v|$ and $u <_{lex} v$

Definition (total order \prec)

For every $u, v \in \{0, 1\}\mathcal{D}^*$, we define $u \prec v$ if and only if

- $u \in 1\mathcal{D}^*$ and $v \in 0\mathcal{D}^*$, or
- $u, v \in 0\mathcal{D}^*$ and $u <_{rad} v$, or
- $u, v \in 1\mathcal{D}^*$ and $u <_{rev} v$.

Characterization by a particular total order

n	-5	-4	-3	-2	-1	0	1	2	3	4
$\text{rep}_{2c}(n)$	1011	100	101	10	1	0	01	010	011	0100

Radix order: $u <_{rad} v$ if and only if $|u| < |v|$ or $|u| = |v|$ and $u <_{lex} v$

Reversed order: $u <_{rev} v$ if and only if $|u| > |v|$ or $|u| = |v|$ and $u <_{lex} v$

Definition (total order \prec)

For every $u, v \in \{0, 1\}\mathcal{D}^*$, we define $u \prec v$ if and only if

- $u \in 1\mathcal{D}^*$ and $v \in 0\mathcal{D}^*$, or
- $u, v \in 0\mathcal{D}^*$ and $u <_{rad} v$, or
- $u, v \in 1\mathcal{D}^*$ and $u <_{rev} v$.

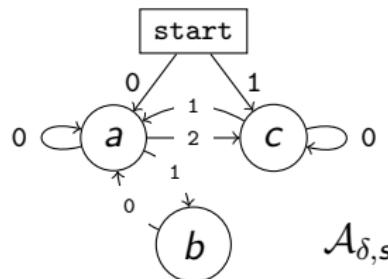

Theorem (Labbé, L.)

Let $\eta : A^* \rightarrow A^*$ be a substitution and \mathbf{u} be its two-sided periodic point with growing seed s and period $p \geq 1$. Let $f : \mathbb{Z} \rightarrow \{0, 1\}\mathcal{D}^*$ be a map. Then $f = \text{rep}_{\mathbf{u}}$ if and only if f is increasing w.r.t. \prec , its image is $f(\mathbb{Z}) = \bigcup_{\ell \in \mathbb{N}} \mathcal{L}_{\ell p+1}(\mathcal{A}_{\eta, s}) \setminus \{0w_{\min}, 1w_{\max}\}\mathcal{D}^*$ and $f(0) = 0$.

Extension to \mathbb{Z}^2

A substitution $\delta: a \mapsto abc, b \mapsto a, c \mapsto ca$ has a periodic point

$\mathbf{d} = \dots caabc.abcacaabc\dots$ with growing seed $s = c|a$ and $p = 2$

n	$\text{rep}_{\mathbf{d}}(n)$	n	$\text{rep}_{\mathbf{d}}(n)$
6	00100	-1	1
5	021	-2	111
4	020	-3	110
3	010	-4	101
2	002	-5	100
1	001	-6	11102
0	0	-7	11101

We denote $w_{\min} = 00$ and $w_{\max} = 12$. Let $w \in \mathcal{L}(\mathcal{A}_{\delta,s})$. Then

$$\mathcal{A}_{\delta,s}(w) = \begin{cases} \mathcal{A}_{\delta,s}(0(w_{\min})^* v), & \text{if } w = 0v; \\ \mathcal{A}_{\delta,s}(1(w_{\max})^* v), & \text{if } w = 1v. \end{cases}$$

This is why w_{\min} and w_{\max} are called **neutral words**.

We represent $\mathbf{n} = (6, -5) \in \mathbb{Z}^2$ as

$$\begin{pmatrix} \text{rep}_{\mathbf{d}}(6) \\ \text{rep}_{\mathbf{d}}(-5) \end{pmatrix} = \begin{pmatrix} 00100 \\ 100 \end{pmatrix} = \begin{pmatrix} 00100 \\ 11200 \end{pmatrix}.$$

Extension to \mathbb{Z}^d

Definition (Numeration system for \mathbb{Z}^d)

Let $\eta : A^* \rightarrow A^*$ be a substitution and \mathbf{u} its periodic point with growing seed. For every $\mathbf{n} = (n_1, n_2, \dots, n_d) \in \mathbb{Z}^d$, we define

$$\text{rep}_{\mathbf{u}}(\mathbf{n}) = \begin{pmatrix} \text{pad}_t(\text{rep}_{\mathbf{u}}(n_1)) \\ \text{pad}_t(\text{rep}_{\mathbf{u}}(n_2)) \\ \vdots \\ \text{pad}_t(\text{rep}_{\mathbf{u}}(n_d)) \end{pmatrix} \in \{0, 1\}^d (\mathcal{D}^d)^*,$$

where pad_t inserts corresponding neutral word w_{\min} or w_{\max} into representations up to length $t = \max\{|\text{rep}_{\mathbf{u}}(n_i)| : 1 \leq i \leq d\}$.
